

FUME EXTRACTION SOLUTIONS

Simple filter replacement

Powerful control electronics

Industrial safety and health protection

Vent out any particulate or fumes from the product composition during the marking process by adding this option to any of our marking solutions.

Off-gassing from the marking process is collected by the fume extraction and transported into the filter unit directly, or through a pipe or flexible hose. In the filter unit, contaminants particles are filtered into different levels according to their size. The purified air can either be circulated back into the work area or diverted outside via an exhaust duct. Recirculating the purified air in the work area provides a healthy work environment and reduces energy costs.
